

ORIGINAL FILE

This is the original file, as it appears when opened in the browser as a regular HTML file. I have included this here so it is easier to compare how accurate the email renditions are to the original, intended file.

GMAIL

This is the file as it appears when sent to a gmail address. The formatting and appearance match. The blue “Learn More” button retains full functionality. Clicking it redirects to the official iPhone Duo announcement. However, the “Display”, “Camera”, and “Productivity” links, which dynamically change some of the text on the advert, no longer work. I imagine this works in the browser, because it can dynamically update, but not in the email, because it is likely a static render of the HTML that can’t be updated. This is good to consider for future updates, to maintain compatibility. The “See another detail” link also doesn’t work, as it dynamically adds a bit of text. Other than that, the page retains full functionality, scaling, and appearance.

ICLOUD

Functionally, the icloud email test works the same as the gmail test. The learn more button works, while the others don't, since they are intended to update text. The images, text, and colors are rendered as intended. The only notable difference I observed between this test and the gmail test, are the scale of the page. It was much smaller and harder to read than the gmail test, and had much more empty space in the margins. I had to zoom in significantly to read and test it. This might be a result of the email provider, or simply how it renders on phones. I will have to keep this in mind for further tests, as the gmail test was performed on my laptop, whereas the iCloud test was on my phone.

OUTLOOK

To: Ivan Estrada 2

The file is significantly less compatible with Outlook. The background image is not rendered, nor is the “Learn More” button. The links also don’t work, but also aren’t highlighted blue, either. The coloration is also notably different, likely overwritten by outlook’s light/dark mode settings. Most of the text remains visible and remains in the correct positions, and it is better scaled than the icloud test. However, this is the least compatible of the email providers I have tested, in terms of functionality and overall appearance of its elements.
